Figure 1: 풀다가 막힐 때는 이 그림을 봅시다. 아자아자 화이팅!

1 Math

1.1 Basic Mathematics

1.1.1 Trigonometry

- $\sin(\alpha \pm \beta) = \sin \alpha \cos \beta \pm \cos \alpha \sin \beta$
- $\cos(\alpha \pm \beta) = \cos \alpha \cos \beta \mp \sin \alpha \sin \beta$
- $\tan(\alpha \pm \beta) = \frac{\tan \alpha \pm \tan \beta}{1 \mp \tan \alpha \tan \beta}$
- $\sin 2\theta = 2 \sin \theta \cos \theta$
- $c^2 = a^2 + b^2 - 2ab \cos \gamma$

1.1.2 Generating Function

- $\sum_n (pn + q)x^n = \frac{p}{1-x} + \frac{q}{(1-x)^2}$ (Arithmetic progression)
- $\sum_n (rx)^n = (1 - rx)^{-1}$ (Geometric progression)
- $\sum_n \binom{m}{n} x^n = (1 + x)^m$ (Binomial coefficient)
- $\sum_n \binom{m+n-1}{n} x^n = (1 - x)^{-m}$ (Multiset coefficient)

1.1.3 Calculus

- $\int_a^b f(x) dx = \frac{b-a}{6} \left[f(a) + 4f\left(\frac{a+b}{2}\right) + f(b) \right]$ (Simpson's Rule, for cubic poly)
- $\int u'v dx = uv - \int uv' dx$ (Integration by parts)

1.2 Number Theory

1.2.1 Lattice Points under Line

```
// 0 <= x < n, 0 < y <= (a/c)x+(b/c)
ll calc(ll a,ll b,ll c,ll n){
    if(!n)return 0;
    ll tmp=a/c*n*(n-1)/2;
    tmp+=b/c*n;
    return tmp+calc(c,(a*n+b)%c,a%c,((a%c)*n+b%c)/c);
}
```

1.2.2 Shanks' Baby-step Giant-step

Should be **revised**.

```
ll mexp(ll x, ll y, ll p) {
    if(!y) return 1;
    if(y & 1) return x * mexp(x*x%p, y>>1, p) % p;
    return mexp(x*x%p, y>>1, p);
}

vector<ll> get_factor(ll n) {
    vector<ll> v;

        if (a+i == b || s[a+i] < s[b+i]) {b += max(0, i-1); break;}
        if (s[a+i] > s[b+i]) {a = b; break;}
    }
    return a;
}
```

4 Graph Theory

4.1 Strongly Connected Component

```
const int MAXN = 2e5 + 10; // > 2*N
int N, M;
int dfsn[MAXN], low[MAXN], finished[MAXN], cnt;
vector<int> ADJ[MAXN];
vector<vector<int>> G;
stack<int> S;
int f(int x){ // 0 1 2 3 4 5... -> f(1) f(-1) f(2) f(-2) f(3) f(-3)...
    return 2 * (abs(x) - 1) + (x < 0);
}

void add_edge(int x, int y){ // call by f(x), f(y)
    ADJ[x ^ 1].push_back(y);
    ADJ[y ^ 1].push_back(x);
}

// memset(finished, -1, sizeof(finished));
int scc(int here){
    static vector<int> tmp;
    S.push(here);
    dfsn[here] = low[here] = ++cnt;
    int &ret = low[here];
    for(int there : ADJ[here]){

```

```

    if(dfsn[there] == 0) ret = min(ret, scc(there));
    else if(finished[there] == -1) ret = min(ret, dfsn[there]);
}

if(dfsn[here] == low[here]){
    while(1){
        int x = S.top();    S.pop();
        finished[x] = G.size();
        tmp.push_back(x);
        if(x == here) break;
    }
    G.push_back(tmp);
    tmp.clear();
}
return ret;
}

```

4.1.1 2-SAT

- scc를 실행시켜 $f(i)$ 와 $f(-i)$ 가 같은 component에 있다면, 모순.
- $f(i)$ 와 $f(-i)$ 중 finished 배열의 수가 작은 것이 참이다.
 - SCC numbering의 역순이 위상정렬이기에, $F \rightarrow T$ 를 유지하기 위함

4.2 Biconnected Component

```

// https://gist.github.com/koosaga/6f6fd50dd7067901f1b1
void dfs(int x, int p){
    dfn[x] = low[x] = ++piv;
    par[x] = p;
    for(int i=0; i<graph[x].size(); i++){
        int w = graph[x][i];
        if(w == p) continue;
        if(!dfn[w]){
            dfs(w, x);
            low[x] = min(low[x], low[w]);
        }
        else{
            low[x] = min(low[x], dfn[w]);
        }
    }
}

void color(int x, int c){
    if(c > 0) bcc[x].push_back(c); // c == 0 : first component
    vis[x] = 1;
    for(int i=0; i<graph[x].size(); i++){
        int w = graph[x][i];
        if(vis[w]) continue;
        if(dfn[x] <= low[w]){

```

```

        bcc[x].push_back(++cpiv);
        color(w, cpiv);
    }
    else{
        color(w, c);
    }
}
}

```

4.3 Euler Tour

```

struct Edge{
    int to, cnt; // to: 인접한 정점, cnt: 남은 사용 횟수
    Edge *dual; // dual: 역방향 간선을 가리키는 포인터
    Edge(): Edge(-1, 0){}
    Edge(int to1, int cnt1): to(to1), cnt(cnt1), dual(nullptr){}
};

void Eulerian(int curr){
    for(Edge *e: adj[curr]){
        if(e->cnt > 0){
            e->cnt--;
            e->dual->cnt--;
            Eulerian(e->to); // dfs
        }
    }
    cout << curr << '\n';
}

```

4.4 Heavy-Light Decomposition

```

int N, M;
vector<int> ADJ[MAXN];
int S[MAXN];
int hld_head[MAXN], color[MAXN], dfsn[MAXN], dcnt, hcnt;
int P[MAXN];

void dfs1(int here, int par){
    S[here] = 1; P[here] = par;
    for(int there : ADJ[here]) if(there != par) dfs1(there, here), S[here] += S[there];
}

void dfs2(int here, int c){ // dfs reordering
    if(hld_head[c] == 0) hld_head[c] = here;
    dfsn[here] = ++dcnt; color[here] = c;

    sort(ADJ[here].begin(), ADJ[here].end(), [&](int x, int y){
        return S[x] > S[y];
    });

    int cnt = 0;

```

```
for(int there : ADJ[here]) if(there != P[here]){
    if(++cnt == 1) dfs2(there, c);
    else dfs2(there, ++hcnt);
}
}
```

4.5 Dominator Tree

Should be **added**.

4.6 Negative Cycle Detection

Should be **added**.

4.7 Tree Compress

Should be **added**.

4.8 Stoer–Wagner Algorithm

Should be **added**.

5 Network Flow

5.1 Theorems

Max-flow Min-cut theorem : 정점 s 에서 정점 t 까지 흐를 수 있는 최대 유량(max-flow)은 정점 s 와 정점 t 를 분리하는 간선들의 가중치 합(min-cut)과 같다.

Vertex cover : 어떤 그래프의 정점의 집합 S 에 대해 그래프의 모든 간선이 S 의 원소 중 최소 하나와 연결되어 있을 때, S 를 해당 그래프의 vertex cover라고 하며, minimum vertex cover는 최소 개수의 정점을 사용한 vertex cover이다.

Independent set : 어떤 그래프의 정점의 집합 S 에 대해 S 의 서로 다른 두 정점을 연결하는 간선이 없을 때, S 를 해당 그래프의 independent set이라고 하며, maximum independent set은 최대 개수의 정점을 사용한 independent set이다.

Matching (independent edge set) : 어떤 그래프의 간선의 집합 S 에 대해 S 의 서로 다른 두 간선이 공통된 정점을 가지지 않을 때, S 를 해당 그래프의 matching이라고 하며, maximum matching은 최대 개수의 간선을 사용한 matching이다.

König's theorem : 이분 그래프의 maximum matching의 크기는 minimum vertex cover의 것과 같다.

Dinic's Algorithm : 시간 복잡도 $O(V^2E)$, unit capacity에서는 $\min(V^{2/3}E, E^{3/2})$.

Circulation Problem : 새로운 source/sink s_n, t_n 를 만들어서 다음과 같이 간선을 추가하고 $\text{maxflow}(s_n \rightarrow t_n) = \sum l_i$ 인지 확인, 이후 $s \rightarrow t$ 로 maxflow

- $s_n \rightarrow b(l), a \rightarrow t_n(l), a \rightarrow b(r-l), t \rightarrow s(\infty)$

5.2 Dinic's Algorithm

```
const int INF = 1e9;
struct Dinic{
    int N;
    struct edge{
        int index, cap, rev;
        edge() : index(0), cap(0), rev(0) {}
    };
    vector<edge> ADJ;
```

```
    edge(int index, int cap, int rev) : index(index), cap(cap), rev(rev) {}
};
```

```
vector<vector<edge>> ADJ;
vector<int> R, W;
```

```
Dinic() {}
Dinic(int N) : N(N){
    ADJ.resize(N); R.resize(N); W.resize(N);
}
```

```
void CE(int node1, int node2, int cap){
    ADJ[node1].push_back(edge(node2, cap, ADJ[node2].size()));
    ADJ[node2].push_back(edge(node1, 0, ADJ[node1].size() - 1));
}
```

```
bool bfs(int src, int sink){
    fill(R.begin(), R.end(), -1);
    R[src] = 0;
    queue<int> Q; Q.push(src);
    while(Q.size()){
        int here = Q.front(); Q.pop();
        for(auto e : ADJ[here]){
            if(e.cap > 0 && R[e.index] == -1)
                R[e.index] = R[here] + 1, Q.push(e.index);
        }
    }
    return R[sink] != -1;
}
```

```
int dfs(int here, int sink, int f){
    if(here == sink) return f;
    for(int &i = W[here] ; i < ADJ[here].size() ; i++){
        auto &e = ADJ[here][i];
        if(e.cap > 0 && R[here] < R[e.index]){
            int res = dfs(e.index, sink, min(f, e.cap));
            if(res) {
                e.cap -= res;
                ADJ[e.index][e.rev].cap += res;
                return res;
            }
        }
    }
    return 0;
}
```

```
int solve(int src, int sink){
    int ret = 0;
    while(bfs(src, sink)){

            }
            p[j1] = i0;
        }
    }
}

```

```

        for (int j=0; j<=m; ++j) {
            if (used[j]) {
                u[p[j]] += delta, v[j] -= delta;
            }
            else {
                minv[j] -= delta;
            }
        }
        j0 = j1;
    } while (p[j0] != 0);
    do {
        int j1 = way[j0];
        p[j0] = p[j1];
        j0 = j1;
    } while (j0);
    }
    ans.resize(n + 1);
    for(int j=1; j<=m; ++j) {
        ans[p[j]] = j;
    }
    return -v[0];
}
}

```

5.5 Hopcroft-Karp Algorithm

```

struct hopcroft_karp{
    int N;
    vector<vector<int>> ADJ;
    vector<int> L, rev, used;

    hopcroft_karp() {}
    hopcroft_karp(int N) : N(N) {
        ADJ.resize(N);
        L.resize(N), rev.resize(N, -1), used.resize(N, 0);
    }

    void CE(int here, int there){
        ADJ[here].push_back(there);
    }

    void bfs(){
        queue<int> Q;
        for(int i = 0 ; i < N ; i++) {
            if(used[i]) L[i] = -1;
            else L[i] = 0, Q.push(i);
        }

        while(Q.size()){
            int here = Q.front(); Q.pop();
            for(int there : ADJ[here]){

```

```

                if(rev[there] != -1 && L[rev[there]] == -1) {
                    L[rev[there]] = L[here] + 1;
                    Q.push(rev[there]);
                }
            }
        }

        bool dfs(int here){
            for(int there : ADJ[here]){
                if(rev[there] == -1 || (L[here] < L[rev[there]] && dfs(rev[there]))){
                    rev[there] = here;
                    used[here] = 1;
                    return true;
                }
            }
            return false;
        }

        int solve(){
            int ret = 0;
            while(1){
                bfs();
                int res = 0;
                for(int i = 0 ; i < N ; i++) {
                    if(used[i]) continue;
                    res += dfs(i);
                }
                if(res == 0) break;
                ret += res;
            }
            return ret;
        }
    };
}

```

6 Optimization Tricks

6.1 Knuth Optimization

- Recurrence : $D[i][j] = \min_{i < k < j} (D[i][k] + D[k][j]) + C[i][j]$
- Quadrangle Inequality : $C[a][c] + C[b][d] \leq C[a][d] + C[b][c]$, $a \leq b \leq c \leq d$
- Monotonicity : $C[b][c] \leq C[a][d]$, $a \leq b \leq c \leq d$
- $A[i][j] = (\min. k \text{ s.t. } D[i][j] \text{ is min.}).$ Then $A[i][j-1] \leq A[i][j] \leq A[i+1][j]$
- $O(N^2)$ time complexity

```

// opt[i-1][i] = i
for(int d=2; d<=n; d++) {
    for(int i=1; i+d<=n+1; i++) {

```

```

    for(int k=opt[i][j-1], j=i+d; k<=opt[i+1][j]; k++) {
        int v = dp[i][k] + dp[k][j] + c[i][j];
        if(dp[i][j] > v) dp[i][j] = v, opt[i][j] = k;
    }
}
}

```

6.2 Divide and Conquer Optimization

- Recurrence : $D[t][i] = \min_{k < i} (D[t-1][k] + C[k][i])$
- Min index : $A[t][i] \leq A[t][i+1]$ ($A[t][i] = (\min. k \text{ s.t. } D[t][i] \text{ is min.})$)
 - [-] Quadrangle Inequality : $C[a][c] + C[b][d] \leq C[a][d] + C[b][c]$, $a \leq b \leq c \leq d$
- Able to Divide and Conquer base on calculating $D[t][i]$
- $O(TN \lg N)$ time complexity

```

// range of index : [l,r]
// range of dp     : [s,e]
void dnc(int t, int l, int r, int s, int e)
{
    if(s > e) return;
    int m = (s+e)/2;
    D[t][m] = 2e9;
    for(int k=l; k<m&& k<=r; k++)
    {
        int tmp = D[t-1][k] + C[k][m];
        if(D[t][m] > tmp)
            D[t][m] = tmp, A[t][m] = k;
    }
    dnc(t, l, A[t][m], s, D[t][m]-1);
    dnc(t, A[t][m], r, D[t][m]+1, e);
}

```

6.3 Convex Hull Trick

- Recurrence : $dp[i] = \min_{j < i} (dp[j] + a[i]b[j])$, $b[i-1] \leq b[i]$
- Think as $dp[x = a[i]] = \min_{j < i} (b[j] \cdot x + dp[j])$
- Thus push lines and find minimum (by binary search)
- If $a[i] \leq a[i+1]$ sweeping is possible
- Intersection of $y = a_i x + b_i$ and $y = a_{i+1} x + b_{i+1}$: $x = \frac{b_{i+1} - b_i}{a_i - a_{i+1}}$

6.4 Centroid Decomposition

```

// credit : https://gist.github.com/igorcarpanese/75162f3253bd230abd0f32f9950bf384
int dfs(int u, int p) {
    sub[u] = 1;
    for (auto v : tree[u])
        if (v != p) sub[u] += dfs(v, u);
    return sub[u] + 1;
}

int centroid(int u, int p, int r) { // r : root
    for (auto v : tree[u])
        if (v != p and sub[v] > sub[r]/2) return centroid(v, u);
    return u;
}

```

7 Data Structure

7.1 Persistent Segment Tree

```

const MAXN = 1e5 + 10;
struct node{
    node *l, *r;
    int cnt;
    node () {}
} pool[(1 << 17) * 17], *tree_head[MAXN];

int tcnt;
node* alloc(){
    memset(pool + tcnt, 0, sizeof(node));
    return pool + tcnt++;
}

node * init(int l, int r){
    node *ret = alloc();
    if(l != r) {
        int mid = (l + r) / 2;
        ret->l = init(l, mid);
        ret->r = init(mid + 1, r);
    }
    return ret;
}

void update(node * here, node *par, int l, int r, int val){
    if(l == r) {
        here->cnt = par->cnt + 1;
        return;
    }

    int mid = (l + r) / 2;
    if(val <= mid){

```

```

    here->l = alloc();
    here->r = par->r;
    update(here->l, par->l, l, mid, val);
}
else {
    here->l = par->l;
    here->r = alloc();
    update(here->r, par->r, mid + 1, r, val);
}
here->cnt = here->l->cnt + here->r->cnt;
}

int query(node *node1, node *node2, int l, int r, int k){
    if(l == r) return l;
    int ccc = node1->l->cnt - node2->l->cnt;
    int mid = (l + r) / 2;
    if(k <= ccc) return query(node1->l, node2->l, l, mid, k);
    else return query(node1->r, node2->r, mid + 1, r, k - ccc);
}

```

7.2 Link-Cut Tree

```

struct node{
    node *pp, *p, *l, *r;
    int val;
    node(){ p = 0, l = 0, r = 0;}
    node(int val) : val(val) { p = 0, l = 0, r = 0;}
};

```

```

void push(node *x){}
void pull(node *x){}

```

```

void rotate(node *x){
    if(!x->p) return;
    push(x->p); // if there's lazy stuff
    push(x);
    node *p = x->p;
    bool is_left = (p->l == x);
    node *b = (is_left ? x->r : x->l);
    x->p = p->p;
    if(x->p && x->p->l == p) x->p->l = x;
    if(x->p && x->p->r == p) x->p->r = x;
    if(is_left){
        if(b) b->p = p;
        p->l = b;
        p->p = x;
        x->r = p;
    }
    else{
        if(b) b->p = p;
        p->r = b;
    }
}

```

```

    p->p = x;
    x->l = p;
}
pull(p); // if there's something to pull up
pull(x);
//if(!x->p) root = x; // IF YOU ARE SPLAY TREE

        p->l = nullptr;
    }
    pull(p);
}

```

7.3 Dynamic Convex Hull

```

// https://github.com/niklasb/contest-algos/blob/master/convex_hull/dynamic.cpp
const ll is_query = -(1LL<<62);
struct Line {
    ll m, b;
    mutable function<const Line*> succ;

```

```

    bool operator<(const Line& rhs) const {
        if (rhs.b != is_query) return m < rhs.m;
        const Line* s = succ();
        if (!s) return 0;
        ll x = rhs.m;
        return b - s->b < (s->m - m) * x;
    }
};
struct HullDynamic : public multiset<Line> { // will maintain upper hull for maximum
    bool bad(iterator y) {
        auto z = next(y);
        if (y == begin()) {
            if (z == end()) return 0;
            return y->m == z->m && y->b <= z->b;
        }
        auto x = prev(y);
        if (z == end()) return y->m == x->m && y->b <= x->b;
        return (x->b - y->b)*(z->m - y->m) >= (y->b - z->b)*(y->m - x->m);
    }
    void insert_line(ll m, ll b) {
        auto y = insert({m, b});
        y->succ = [=] { return next(y) == end() ? 0 : &*next(y); };
        if (bad(y)) { erase(y); return; }
        while (next(y) != end() && bad(next(y))) erase(next(y));
        while (y != begin() && bad(prev(y))) erase(prev(y));
    }
    ll eval(ll x) {
        auto l = *lower_bound((Line) { x, is_query });
        return l.m * x + l.b;
    }
};

7.4 Stern-Brocot Tree

// __int128 is recommended
bool test(ll a, ll b) { // for testing directions, vary by prob
    // return true if (true value) >= a/b
    ll n = 0, m = 1;

    rep(i, N) {
        if (n < m*A[i].fi) n = A[i].fi, m = 1;

        ll c = b*n+m*a, d = m*b;
        ll g = gcd(c, d);
        n = c/g;
        m = d/g;

        if (n > m*A[i].se) return false;
    }
    return true;
}

```

```

pair<ll, ll> stern_brocot(ll M, ll N) {
    // M : max value
    // N : max divisor
    // if result is a/b, return as {a, b}
    ll a = 0, b = 1; // 1
    ll c = 1, d = 0; // r
    int l, r;
    bool chg = true;

    while(chg) {
        chg = false;

        // to left
        l = 0, r = (N-d-1)/b+1;
        while(l < r) {
            int mid = (l+r+1)/2;
            if (test(a*mid+c, b*mid+d)) r = mid-1;
            else l = mid;
        }

        c += a*l;
        d += b*l;
        chg |= (l > 0);

        // to right
        l = 0, r = (d?(N-b-1)/d+1:M);
        while(l < r) {
            int mid = (l+r+1)/2;
            if (test(a+mid*c, b+mid*d)) l = mid;
            else r = mid-1;
        }

        a += c*l;
        b += d*l;
        chg |= (l > 0);
    }

    return {a, b};
}

```

7.5 Rope

Should be **added**.

7.6 Policy Based Data Structure

```

#include <bits/stdc++.h>
#include <ext/pb_ds/assoc_container.hpp>
#include <ext/pb_ds/tree_policy.hpp>
#include <ext/pb_ds/detail/standard_policies.hpp>

```

```

using namespace std;
using namespace __gnu_pbds;

typedef tree<
    int,
    null_type,
    less<int>,
    rb_tree_tag,
    tree_order_statistics_node_update >
    ordered_set;

// less<int> : not allow for duplicate
// less_equal<int> : allow for duplicate
// use upper_bound when you erase from set used less_equal

int N;

int main(void) {
    iostream::sync_with_stdio(false);
    cin.tie(nullptr);

    ordered_set X;

    X.insert(1);
    X.insert(2);
    X.insert(4);
    X.insert(8);
    X.insert(16);

    cout<<*X.find_by_order(1)<<endl; // 2
    cout<<*X.find_by_order(2)<<endl; // 4
    cout<<*X.find_by_order(4)<<endl; // 16
    cout<<(end(X)==X.find_by_order(6))<<endl; // true

    cout<<X.order_of_key(-5)<<endl; // 0
    cout<<X.order_of_key(1)<<endl; // 0
    cout<<X.order_of_key(3)<<endl; // 2
    cout<<X.order_of_key(4)<<endl; // 2
    cout<<X.order_of_key(400)<<endl; // 5
}

```

8 Miscellaneous

8.1 Misc Formulae and Algorithms

8.1.1 Faulhaber's Formula

$$T(n, k) = \sum_{i=1}^n i^k = \frac{(n+1)^{k+1} - 1^{k+1} - \sum_{j=0}^{k-1} \binom{k+1}{j} T(n, j)}{\binom{k+1}{k}}$$

Also use

$$(x+1)^d - x^d = 1 + \binom{d}{1}x + \binom{d}{2}x^2 + \dots + \binom{d}{d-1}x^{d-1}$$

to get each coef.

8.1.2 Maximum Clique

```
typedef long long ll;
ll G[40]; // 0-index
int N, M;
int cur;
void get_clique(int R = 0, ll P = (1ll<<N)-1, ll X = 0){
    if((P|X) == 0){
        cur = max(cur, R);
        return;
    }
    int u = __builtin_ctzll(P|X);
    ll c = P&~G[u];
    while(c){
        int v = __builtin_ctzll(c);
        get_clique(R + 1, P&G[v], X&G[v]);
        P ^= 1ll << v;
        X |= 1ll << v;
        c ^= 1ll << v;
    }
}
```

8.1.3 De Bruijn Sequence

NTT Prime:

469762049 = $7 \times 2^{26} + 1$. Primitive root : 3.
 998244353 = $119 \times 2^{23} + 1$. Primitive root: 3.
 985661441 = $235 \times 2^{22} + 1$. Primitive root: 3.
 1012924417 = $483 \times 2^{21} + 1$. Primitive root: 5.

8.3 Fast Integer IO

```
// credit : https://github.com/koosaga/DeobureoMinkyuParty/blob/master/teamnote.tex
static char buf[1 << 19]; // size : any number geq than 1024
static int idx = 0;
static int bytes = 0;
static inline int _read() {
    if (!bytes || idx == bytes) {
        bytes = (int)fread(buf, sizeof(buf[0]), sizeof(buf), stdin);
        idx = 0;
    }
    return buf[idx++];
}
static inline int _readInt() {
    int x = 0, s = 1;
    int c = _read();
    while (c <= 32) c = _read();
    if (c == '-') s = -1, c = _read();
    while (c > 32) x = 10 * x + (c - '0'), c = _read();
    if (s < 0) x = -x;
    return x;
}
```

8.4 C++ Tips / Environments

Should be **revised**.(with random, chrono)

```
#include <bits/stdc++.h> // magic header
using namespace std;    // magic namespace

struct StupidGCCantEvenCompileThisSimpleCode{
```

```
pair<int, int> array[1000000];
}; // https://gcc.gnu.org/bugzilla/show_bug.cgi?id=68203

// how to use rand (in 2017)
mt19937 rng(0xdeadbeef);
mt19937 rng(chrono::steady_clock::now().time_since_epoch().count());
int randint(int lb, int ub){ return uniform_int_distribution<int>(lb, ub)(rng); }
shuffle(permutation.begin(), permutation.end(), rng);
mt19937_64 _R(chrono::steady_clock::now().time_since_epoch().count()); // _R()

// comparator overload
auto cmp = [](seg a, seg b){return a.func() < b.func(); };
set<seg, decltype(cmp)> s(cmp);
map<seg, int, decltype(cmp)> mp(cmp);
priority_queue<seg, vector<seg>, decltype(cmp)> pq(cmp); // max heap

// hash func overload
struct point{
int x, y;
bool operator==(const point &p)const{ return x == p.x && y == p.y; }
};
struct hasher {
size_t operator()(const point &p)const{ return p.x * 2 + p.y * 3; }
};
unordered_map<point, int, hasher> hsh;

// c++ setprecision example
#include <iostream> // std::cout, std::fixed
#include <iomanip> // std::setprecision

int main () {
double f =3.14159;
std::cout << std::setprecision(5) << f << '\n'; // 3.1416
std::cout << std::setprecision(9) << f << '\n'; // 3.14159
std::cout << std::fixed;
std::cout << std::setprecision(5) << f << '\n'; // 3.14159
std::cout << std::setprecision(9) << f << '\n'; // 3.141590000
return 0;
}
```
