Figure 1: 풀다가 막힐 때는 이 그림을 봅시다. 아자아자 화이팅!

1 Math

1.1 Basic Mathematics

1.1.1 Trigonometry

- $\sin(\alpha \pm \beta) = \sin \alpha \cos \beta \pm \cos \alpha \sin \beta$
- $\cos(\alpha \pm \beta) = \cos \alpha \cos \beta \mp \sin \alpha \sin \beta$
- $\tan(\alpha \pm \beta) = \frac{\tan \alpha \pm \tan \beta}{1 \mp \tan \alpha \tan \beta}$
- $\sin 2\theta = 2 \sin \theta \cos \theta$
- $c^2 = a^2 + b^2 - 2ab \cos \gamma$

1.1.2 Generating Function

- $\sum_n (pn + q)x^n = \frac{p}{1-x} + \frac{q}{(1-x)^2}$ (Arithmetic progression)
- $\sum_n (rx)^n = (1 - rx)^{-1}$ (Geometric progression)
- $\sum_n \binom{m}{n} x^n = (1 + x)^m$ (Binomial coefficient)
- $\sum_n \binom{m+n-1}{n} x^n = (1 - x)^{-m}$ (Multiset coefficient)

1.1.3 Calculus

- $\int_a^b f(x) dx = \frac{b-a}{6} \left[f(a) + 4f\left(\frac{a+b}{2}\right) + f(b) \right]$ (Simpson's Rule, for cubic poly)
- $\int u'v dx = uv - \int uv' dx$ (Integration by parts)

1.1.4 Combinatorics

$\begin{bmatrix} n \\ k \end{bmatrix}$ (Stirling numbers of the first kind / n elem, k cycle)

- $\begin{bmatrix} n+1 \\ k \end{bmatrix} = n \begin{bmatrix} n \\ k \end{bmatrix} + \begin{bmatrix} n \\ k-1 \end{bmatrix}$, $\begin{bmatrix} n \\ 0 \end{bmatrix} = \begin{bmatrix} 0 \\ n \end{bmatrix} = 1$

$\begin{Bmatrix} n \\ k \end{Bmatrix}$ (Stirling numbers of the second kind / n elem, k unlabeled subset)

- $\begin{Bmatrix} n+1 \\ k \end{Bmatrix} = k \begin{Bmatrix} n \\ k \end{Bmatrix} + \begin{Bmatrix} n \\ k-1 \end{Bmatrix}$, $\begin{Bmatrix} n \\ 0 \end{Bmatrix} = \begin{Bmatrix} 0 \\ n \end{Bmatrix} = 1$

B_n (Bell number, n elem, partition)

- $B_{n+1} = \sum_{k=0}^n \binom{n}{k} B_k$, $B_{n+1} = \sum_{k=0}^n \begin{Bmatrix} n \\ k \end{Bmatrix}$

- $B_{p^m+n} \equiv mB_n + B_{n+1}$

1.2 Number Theory

1.2.1 Lattice Points under Line

$$\text{divsum}(\text{to}, c, k, m) = \sum_{i=0}^{\text{to}-1} \left\lfloor \frac{ki + c}{m} \right\rfloor, \text{modsum}(\text{to}, c, k, m) = \sum_{i=0}^{\text{to}-1} (ki + c) \% m$$

        return cs;
    }
}
```

```
void addE(int x, int y) {E[x].pb(y);}
}
```

4.6 Global Min Cut

```
// Stoer-Wagner Algorithm, O(VE lg E)
int minimum_cut_phase(int n, int &s, int &t,
    vector<vector<int>> &adj, vector<int> vis){
    vector<int> dist(n);
    int mincut = 1e9;
    while(true){
        int pos = -1, cur = -1e9;
        for(int i=0; i<n; i++){
            if(!vis[i] && dist[i] > cur){
                cur = dist[i];
                pos = i;
            }
        }
        if(pos == -1) break;
        s = t;
        t = pos;
        mincut = cur;
        vis[pos] = 1;
        for(int i=0; i<n; i++){
            if(!vis[i]) dist[i] += adj[pos][i];
        }
    }
    return mincut; // optimal s-t cut here is, {t} and V \ {t}
}

int solve(int n, vector<vector<int>> adj){
    if(n <= 1) return 0;
    vector<int> vis(n);
    int ans = 1e9;
    for(int i=0; i<n-1; i++){
        int s, t;
        ans = min(ans, minimum_cut_phase(n, s, t, adj, vis));
        vis[t] = 1;
        for(int j=0; j<n; j++){
            if(!vis[j]){
                adj[s][j] += adj[t][j];
                adj[j][s] += adj[j][t];
            }
        }
        adj[s][s] = 0;
    }
    return ans;
}
```

5 Network Flow

5.1 Theorems

Max-flow Min-cut theorem : 정점 s 에서 정점 t 까지 흐를 수 있는 최대 유량(max-flow)은 정점 s 와 정점 t 를 분리하는 간선들의 가중치 합(min-cut)과 같다.

Vertex cover : 어떤 그래프의 정점의 집합 S 에 대해 그래프의 모든 간선이 S 의 원소 중 최소 하나와 연결되어 있을 때, S 를 해당 그래프의 vertex cover라고 하며, minimum vertex cover는 최소 개수의 정점을 사용한 vertex cover이다.

Independent set : 어떤 그래프의 정점의 집합 S 에 대해 S 의 서로 다른 두 정점을 연결하는 간선이 없을 때, S 를 해당 그래프의 independent set이라고 하며, maximum independent set은 최대 개수의 정점을 사용한 independent set이다.

Matching (independent edge set) : 어떤 그래프의 간선의 집합 S 에 대해 S 의 서로 다른 두 간선이 공통된 정점을 가지지 않을 때, S 를 해당 그래프의 matching이라고 하며, maximum matching은 최대 개수의 간선을 사용한 matching이다.

König's theorem : 이분 그래프의 maximum matching의 크기는 minimum vertex cover의 것과 같다.

Dinic's Algorithm : 시간 복잡도 $O(V^2E)$, unit capacity에서는 $\min(V^{2/3}E, E^{3/2})$.

Circulation Problem : 새로운 source/sink s_n, t_n 를 만들어서 다음과 같이 간선을 추가하고 $\maxflow(s_n \rightarrow t_n) = \sum l_i$ 인지 확인, 이후 $s \rightarrow t$ 로 maxflow

- $s_n \rightarrow b(l), a \rightarrow t_n(l), a \rightarrow b(r-l), t \rightarrow s(\infty)$

5.2 Dinic's Algorithm

```
template<typename T>
struct Dinic{
    const T INF = 1e9;
    int N;
    struct edge{
        T index, cap, rev;
        edge(T index=0, T cap=0, T rev=0) : index(index), cap(cap), rev(rev) {}
    };

    vector<vector<edge>> ADJ;
    vector<int> R, W;

    Dinic(int N=0) : N(N), ADJ(N), R(N), W(N) {}

    void CE(int node1, int node2, int cap){
        ADJ[node1].push_back(edge(node2, cap, ADJ[node2].size()));
        ADJ[node2].push_back(edge(node1, 0, ADJ[node1].size() - 1));
    }

    bool bfs(int src, int sink){
        fill(R.begin(), R.end(), -1); R[src] = 0;
        queue<int> Q; Q.push(src);
        while(Q.size()){
            int here = Q.front(); Q.pop();
            for(auto e : ADJ[here]){
                if(e.cap > 0 && R[e.index] == -1)
                    R[e.index] = R[here] + 1, Q.push(e.index);
            }
        }
    }
};
```

```
    }
    return R[sink] != -1;
}

T dfs(int here, int sink, T f){
    if(here == sink) return f;
    for(int &i = W[here] ; i < ADJ[here].size() ; i++){
        auto &e = ADJ[here][i];
        if(e.cap > 0 && R[here] < R[e.index]){
            T res = dfs(e.index, sink, min(f, e.cap));
            if(res) {
                e.cap -= res;
                ADJ[e.index][e.rev].cap += res;
                return res;
            }
        }
    }
    return 0;
}

        ret += res;
    }
    return ret;
}
};

```

6 Optimization Tricks

An array $P[i][j]$ is **Monge** array if $\forall a \leq b \leq c \leq d, C[a][c] + C[b][d] \leq C[a][d] + C[b][c]$.

6.1 Knuth Optimization

- Recurrence : $D[i][j] = \min_{i < k < j} (D[i][k] + D[k][j]) + C[i][j]$
- Condition : $\forall a \leq b \leq c \leq d, C[i][j]$ is Monge array and $C[b][c] \leq C[a][d]$ (monotonic)
- $A[i][j] = (\min. k \text{ s.t. } D[i][j] \text{ is min.})$. Then $A[i][j-1] \leq A[i][j] \leq A[i+1][j]$
- Time Complexity: $O(N^3) \rightarrow O(N^2)$

```

// opt[i-1][i] = i
for(int d=2;d<=n;d++) {
    for(int i=1;i+d<=n+1;i++) {
        for(int k=opt[i][j-1], j=i+d; k<=opt[i+1][j]; k++) {
            int v = dp[i][k] + dp[k][j] + c[i][j];
            if(dp[i][j] > v) dp[i][j] = v, opt[i][j] = k;
        }
    }
}
}

```

6.2 Divide and Conquer Optimization

- Recurrence : $D[t][i] = \min_{k < i} (D[t-1][k] + C[k][i])$
- Condition: $C[i][j]$ is Monge array.
- $A[t][i] \leq A[t][i+1]$ ($A[t][i] = (\min. k \text{ s.t. } D[t][i] \text{ is min.})$) holds
- Able to Divide and Conquer base on calculating $D[t][i]$
- Time Complexity: $O(TN^2) \rightarrow O(TN \lg N)$

```

// range of index : [l,r]
// range of dp : [s,e]
void dnc(int t, int l, int r, int s, int e)
{
    if(s > e) return;
    int m = (s+e)/2;
    D[t][m] = 2e9;
    for(int k=l;k<=m&&k<=r;k++)
    {
        int tmp = D[t-1][k] + C[k][m];
        if(D[t][m] > tmp)
            D[t][m] = tmp, A[t][m] = k;
    }
    dnc(t, l, A[t][m], s, D[t][m]-1);
    dnc(t, A[t][m], r, D[t][m]+1, e);
}

```

6.3 Convex Hull Trick

- Recurrence : $dp[i] = \min_{j < i} (dp[j] + a[i]b[j])$
- Condition: None, but usually $b[i]$ is monotonic. If not, refer to Section 7.3.
- Time Complexity: $O(N^2) \rightarrow O(N \lg N)$, $O(N)$ if $a[i]$ is monotonic by taking valid front.

```
using ll = long long;
struct line {
    ll a, b, i;
    line(ll a=0, ll b=0, ll i=0) : a(a), b(b), i(i) {}
    ll calc(ll x) { return a*x+b; }
    double inter(line l) { return double(l.b - b) / (a - l.a); }
};
bool check_back(line& p0, line& p1, line& p2) {
    return (p1.b - p0.b) * (p1.a - p2.a) >= (p0.a - p1.a) * (p2.b - p1.b);
    return p0.inter(p1) > p1.inter(p2); // double
}
bool check_front(ll x, line& p0, line& p1) {
    return x * (p0.a - p1.a) >= (p1.b - p0.b);
    return x > p0.inter(p1);
}
struct ConvexHull {
    int l = 0, r = 0;
    vector<line> v;
    void insert(line p) {
        while(r - l >= 2 && check_back(v[r-2], v[r-1], p))
            v.pop_back(), r--;
        v.push_back(p);
    }
    pair<ll, ll> query(ll x) { // if x is increasing, else do binary search
        while(r - l >= 2 && check_front(x, v[l], v[l+1]))
            l++;
        return pair<ll, ll>{v[l].calc(x), v[l].i};
    }
};
void calc() { // psuedo-code
    ConvexHull ch;
    ll val = 0, cnt = 0; // current dp and track
    for(int i=0; i<N; i++) {
        ch.insert(line{p[i], q[i]}); // j-dependent values (b[j], dp[j])
        pll res = ch.query(x[i]);
        val = res.first + c[i]; // i-dependent values
        cnt = res.second + 1;
    }
    return pll{val, cnt};
}
```

6.4 Centroid Decomposition

```
// credit : https://gist.github.com/igorcarpanese/75162f3253bd230abd0f32f9950bf384
int dfs(int u, int p) {
    sub[u] = 1;
    for (auto v : tree[u])
        if (v != p and !chk[v]) sub[u] += dfs(v, u);
    return sub[u] + 1;
} // calc subtree size, chk means that node was a centroid

// each tree has at most two centroids
int centroid(int u, int p, int r) { // r : root
    for (auto v : tree[u])
        if (v != p and !chk[v] and sub[v] > sub[r]/2) return centroid(v, u, r);
    return u;
}
```

6.5 Aliens Trick

- Recurrence: $dp[i][j] = \min_{k < j} (dp[i-1][k] + C[k+1][j])$
- Condition: $dp[*][n]$ is convex (implied if $dp[*][n]$ is Monge array)

```
ll calc(...) {
    // (...)
    k = min(k, (int)v.size());
    ll leff = some_min_value, reff = some_big_value; // check range and overflow
    int lind = v.size(), rind = 1; // range of k, decreases when eff increase
    while(reff - leff >= 2) {
        ll meff = (leff + reff) / 2;
        pll res = calc_with_lambda(v, meff); // {value, k'}
        if(res.second < rind) res.second = rind; // rind (<) lind
        if(res.second > lind) res.second = lind; // lind (>) rind

    string s("Lorem-ipsum");
    int n = s.length();
    rp.append(s.c_str()); // add element

    int x = 3, y = 8; // split and merge below
    rp = rp.substr(x, y-x) + rp.substr(0, x) + rp.substr(y, n);
    cout << rp.at(0) << '\n'; // get element, 'e'
    cout << rp << '\n'; // print, "em-ip|Lor|sum"
}

```

7.6 Bitset

```

#include <bitset>
#include <iostream>
using namespace std;

int main() {
    bitset<8> b1(13); // 00001101
    bitset<8> b2("10111"); // 00010111

    cout << b1.count() << endl; // 3
    cout << b1.test(6) << endl; // 0, since 2^6-th bit is 0
}

```

```

b1.set(6);                // set to 1, 1-fill if no param
b2.reset(2);              // set to 0, 0-fill if no param
// use 'flip' for flipping

cout << "b1:" << b1 << endl;    // b1:01001101
cout << "b2:" << b2 << endl;    // b2:00010011
// use any, none, all (c++11) for bit checking
// supported operators : &, |, ^, <<, >>, ~, ==, !=
// these operators must match size (given to template)

cout << "&:" << (b1 & b2) << endl; // &: 00000001
cout << "^:" << (b1 ^ b2) << endl; // ^: 01011110
cout << "|:" << (b1 | b2) << endl; // |: 01011111
cout << "~:" << (~b1) << endl;    // ~: 10110010
cout << "<<:" << (b1 << 3) << endl; // <<: 01101000
cout << b2.to_ulong() << endl;    // 19, c++11 supports ullong
}

```

7.7 Policy Based Data Structure

```

#include <bits/stdc++.h>
#include <ext/pb_ds/assoc_container.hpp>
#include <ext/pb_ds/tree_policy.hpp>
#include <ext/pb_ds/detail/standard_policies.hpp>

using namespace std;
using namespace __gnu_pbds;

typedef tree<
int,
null_type,
less<int>,
rb_tree_tag,
tree_order_statistics_node_update >
ordered_set;

// less<int> : not allow for duplicate
// less_equal<int> : allow for duplicate
// use upper_bound when you erase from set used less_equal

int N;

int main(void) {
    iosstream::sync_with_stdio(false);
    cin.tie(nullptr);

    ordered_set X;

    X.insert(1);
    X.insert(2);
    X.insert(4);
}

```

```

X.insert(8);
X.insert(16);

cout<<*X.find_by_order(1)<<endl; // 2
cout<<*X.find_by_order(2)<<endl; // 4
cout<<*X.find_by_order(4)<<endl; // 16
cout<<(end(X)==X.find_by_order(6))<<endl; // true

cout<<X.order_of_key(-5)<<endl; // 0
cout<<X.order_of_key(1)<<endl; // 0
cout<<X.order_of_key(3)<<endl; // 2
cout<<X.order_of_key(4)<<endl; // 2
cout<<X.order_of_key(400)<<endl; // 5
}

```

8 Miscellaneous

8.1 Misc Formulae and Algorithms

8.1.1 Faulhaber's Formula

$$T(n, k) = \sum_{i=1}^n i^k = \frac{(n+1)^{k+1} - 1^{k+1} - \sum_{j=0}^{k-1} \binom{k+1}{j} T(n, j)}{\binom{k+1}{k}}$$

Also use

$$(x+1)^d - x^d = 1 + \binom{d}{1}x + \binom{d}{2}x^2 + \cdots + \binom{d}{d-1}x^{d-1}$$

to get each coef.

8.1.2 Maximum Clique

```

typedef long long ll;
ll G[40]; // 0-index
int N, M;
int cur;
void get_clique(int R = 0, ll P = (1ll<<N)-1, ll X = 0){
    if((P|X) == 0){
        cur = max(cur, R);
        return;
    }
    int u = __builtin_ctzll(P|X);
    ll c = P&~G[u];
    while(c){
        int v = __builtin_ctzll(c);
        get_clique(R + 1, P&G[v], X&G[v]);
        P ^= 1ll << v;
        X |= 1ll << v;
        c ^= 1ll << v;
    }
}
}

```

8.1.3 De Bruijn Sequence

```
// https://github.com/koosaga/DeobureoMinkyuParty/blob/master/teamnote.tex
// alphabet = [0, k - 1], substr length n, res starts with 0 (cyclic)
int res[10000000], aux[10000000]; // >= k^n, k*n
int de_bruijn(int k, int n, int lim) { // returns size (k^n)
    if(k == 1) {
        res[0] = 0;
        return 1;
    }
    for(int i = 0; i < k * n; i++) aux[i] = 0;
    int sz = 0;
    function<void(int, int)> db = [&](int t, int p) {
        if(sz > lim) return;
        if(t > n) {
            if(n % p == 0)
                for(int i = 1; i <= p; i++)
                    res[sz++] = aux[i];
        }
        else {
            aux[t] = aux[t - p];
            db(t + 1, p);
            for(int i = aux[t - p] + 1; i < k; i++) {
                aux[t] = i;
                db(t + 1, t);
            }
        }
    };
    db(1, 1);
    return sz;
}
```
