# 1 Math

## 1.1 Basic Mathematics

### 1.1.1 Trigonometry

- $\sin(\alpha \pm \beta) = \sin \alpha \cos \beta \pm \cos \alpha \sin \beta$
- $\cos(\alpha \pm \beta) = \cos \alpha \cos \beta \mp \sin \alpha \sin \beta$
- $\tan(\alpha \pm \beta) = \frac{\tan \alpha \pm \tan \beta}{1 \mp \tan \alpha \tan \beta}$
- $\sin 2\theta = 2 \sin \theta \cos \theta$
- $c^2 = a^2 + b^2 - 2ab \cos \gamma$

### 1.1.2 Generating Function

- $\sum_n (pn + q)x^n = \frac{p}{1-x} + \frac{q}{(1-x)^2}$  (Arithmetic progression)
- $\sum_n (rx)^n = (1 - rx)^{-1}$  (Geometric progression)
- $\sum_n \binom{m}{n} x^n = (1 + x)^m$  (Binomial coefficient)
- $\sum_n \binom{m+n-1}{n} x^n = (1 - x)^{-m}$  (Multiset coefficient)

### 1.1.3 Calculus

- $\int_a^b f(x) dx = \frac{b-a}{6} \left[ f(a) + 4f\left(\frac{a+b}{2}\right) + f(b) \right]$  (Simpson's Rule, for cubic poly)
- $\int u'v dx = uv - \int uv' dx$  (Integration by parts)

## 1.2 Number Theory

### 1.2.1 Lattice Points under Line

```
// 0 <= x < n, 0 < y <= (a/c)x + (b/c)
ll calc(ll a, ll b, ll c, ll n) {
    if(!n) return 0;
    ll tmp = a/c*n*(n-1)/2;
    tmp += b/c*n;
    return tmp + calc(c, (a*n+b)%c, a%c, ((a%c)*n+b%c)/c);
}
```

### 1.2.2 Shanks' Baby-step Giant-step

```
ll mexp(ll x, ll y, ll p) {
    if(!y) return 1;
    if(y & 1) return x * mexp(x*x%p, y>>1, p) % p;
    return mexp(x*x%p, y>>1, p);
}
vector<ll> get_factor(ll n) {
    vector<ll> v;
```

```
for(ll i=2; i*i<=n; i++) {
    if(n % i == 0) {
        v.push_back(i);
        while(n % i == 0) n /= i;
    }
}
if(n > 1) v.push_back(n);
return v;
}
ll get_primitive(ll n) {
    ll phi = n-1; // assume n is prime
    vector<ll> fact = get_factor(phi);
    for(ll x=2; x<=n; x++) {
        int yes = 1;
        for(ll y : fact) {
            yes &= (mexp(x, phi / y, n) != 1);
        }
        if(yes) return x;
    }
    return -1;
}
// find x s.t. x^k mod n = a -> (g^k)^y mod n = a, where x = g^y
ll bsgs(ll k, ll a, ll n) {
    ll g = get_primitive(n);
    ll phi = n-1; // assume n is prime
    if(g == -1) return -1;
    ll m = ceil(sqrt(n) + 1e-9);
    vector<pl> prec(m);
    for(ll j=0; j<m; j++) {
        prec[j] = {mexp(g, j * k % phi, n), j};
    }
    sort(prec.begin(), prec.end());
    ll cur = a, ncur = mexp(g, (phi - m) * k % phi, n);
    for(ll i=0; i<m; i++) {
        auto it = lower_bound(prec.begin(), prec.end(), pl(cur, 0));
        if(it->first == cur) {
            ll ans = mexp(g, (i*m + it->second) % phi, n);
            assert(mexp(ans, k, n) == a);
            return ans;
        }
        cur = cur * ncur % n;
    }
    return 0;
}
```

### 1.2.3 Extended Euclidean Algorithm

```
// ax + by = gcd(a,b). x, y?
pll ext_gcd(ll a, ll b) {
    if(b) {
        auto tmp = ext_gcd(b, a%b);
```

```

        return {tmp.second, tmp.first - (a/b) * tmp.second};
    }
    else return {1, 0};
}

// ax = gcd(a, m) mod m. x?
ll mod_inv(ll a, ll m) {
    return (ext_gcd(a, m).first + m) % m;
}

```

### 1.2.4 Chinese Remainder Theorem

```

ll pos_rem(ll a, ll m) { // m > 0. a % m?
    ll res = abs(a) % m;
    return a > 0 ? res : (res ? m - res : 0);
}

// ax = c mod m, bx = d mod n. x?
ll solve(ll a, ll c, ll m, ll b, ll d, ll n) {
    a = pos_rem(a, m); c = pos_rem(c, m); // if a, c not in [0, m)
    b = pos_rem(b, n); d = pos_rem(d, n); // if b, d not in [0, n)
    ll g = _gcd(a, _gcd(c, m)); a /= g, c /= g, m /= g;
    g = _gcd(b, _gcd(d, n)); b /= g, d /= g, n /= g;
    if(c % _gcd(a, m) || d % _gcd(b, n)) return inf;
    ll t1 = (mod_inv(a, m) * c) % m;
    ll t2 = (mod_inv(b, n) * d) % n;
    g = _gcd(m, n);
    ll lc = m * n / g;
    if(abs(t1 - t2) % g) return inf;
    pl p = ext_gcd(m, n);
    ll q = (t1 * p.second * n/g + t2 * p.first * m/g);
    return pos_rem(q, lc);
}

```

### 1.2.5 Möbius Inversion Formula

$$\forall n \in \mathbb{N} \ g(n) = \sum_{d|n} f(d) \implies f(n) = \sum_{d|n} \mu(d)g(n/d)$$

### 1.3 FFT

$$\text{FFT} : (a_0, a_1, \dots, a_{n-1}) \mapsto (\sum_{j=0}^{n-1} a_0(\omega^0)^j, \sum_{j=0}^{n-1} a_1(\omega^1)^j, \dots, \sum_{j=0}^{n-1} a_{n-1}(\omega^{n-1})^j)$$

```

    P mult(T t) const {return P(x*t, y*t);}
    P unit() const {return P(x/dist(), y/dist());}
    P rotate(double a){
        return P(x*cos(a)-y*sin(a), x*sin(a)+y*cos(a));
    }
}

```

```

    }
};

int sgn(double x) {return (x > eps) - (x < -eps);}
typedef point<double> P;

```

## 2.2 Distance, Intersection

### 2.2.1 Point-to-Line

```

double lineDist(P a, P b, P p) {
    return ((b-a)/(p-a))/(b-a).dist(); // a->b : left (+), right : (-);
}

```

### 2.2.2 Point-to-Segment

```

double segDist(P s, P e, P p) {
    if(s == e) return (p-s).dist(); // mind the eps
    double d = (e-s).dist2(), t = min(d, max(.0, (p-s)*(e-s)));
    return ((p-s).mult(d)-(e-s).mult(t)).dist() / d;
}

```

### 2.2.3 Line intersection

```

template<class P>
pair<int, P> lineInter(P a, P b, P c, P d){
    if((b-a)/(d-c) == 0) // parallel, mind the eps
        return {-(b-a)/(c-a) == 0}, a};
    double oa = (d-c)/(a-c), ob = (d-c)/(b-c);
    return {(a.mult(ob) - b.mult(oa)).mult(1/(ob-oa))};
} // 1,0,-1(inf) : inter

```

### 2.2.4 Segment Intersection

```

bool onSegment(P s, P e, P p) {return segDist(s, e, p) < eps;}

```

```

template<class P> vector<P> segInter(P a, P b, P c, P d){
    double oa = (d-c)/(a-c), ob = (d-c)/(b-c),
           oc = (b-a)/(c-a), od = (b-a)/(d-a);
    if(sgn(oa)*sgn(ob) < 0 && sgn(oc)*sgn(od) < 0)
        return {(a.mult(ob) - b.mult(oa)).mult(1/(ob-oa))};
    set<P> S;
    if(onSegment(c, d, a)) S.insert(a);
    if(onSegment(c, d, b)) S.insert(b);
    if(onSegment(a, b, c)) S.insert(c);
    if(onSegment(a, b, d)) S.insert(d);
    return vector<P>(S.begin(), S.end());
}

```

### 2.2.5 Circle-Line Intersection

Should be **added**.

## 2.3 Convex Hull

```

vector<pll> get_CV(vector<pll> V){
    sort(V.begin(), V.end());
    sort(V.begin() + 1, V.end(), [&](pll x, pll y){
        pll xx = x - V[0];
        pll yy = y - V[0];
        ll res = xx / yy;
        if(res != 0) return res > 0;
        if(xx.first != yy.first) return xx.first < yy.first;
        return xx.second < yy.second;
    });

    vector<pll> ret;
    for(auto val : V){
        while(ret.size() > 1){
            pll xx = ret[ret.size() - 2] - val;
            pll yy = ret[ret.size() - 1] - val;

            if(xx / yy <= 0) ret.pop_back();
            else break;
        }
        ret.push_back(val);
    }

    return ret;
}

```

## 2.4 Rotating Calipers

```

void rotating_calipers(vector<pll> CV){
    int pos = 0;
    for(int i = 0 ; i < CV.size() ; i++) if(CV[pos] < CV[i]) pos = i;

    int ind1 = 0, ind2 = pos;
    ll dist = (CV[ind1] - CV[ind2]) * (CV[ind1] - CV[ind2]);

    auto get_v = [&](int x) { return CV[(x + 1) % CV.size()] - CV[x];};
    for(int i = 0 ; i < CV.size() ; i++){
        pll v = get_v(i);
        while((-v) / get_v(pos) < 0) pos = (pos + 1) % CV.size();
        ll tmp_dist = (CV[pos] - CV[i]) * (CV[pos] - CV[i]);
        if(dist < tmp_dist) {
            dist = tmp_dist;
            ind1 = i; ind2 = pos;
        }
    }

    printf("%lld %lld %lld %lld\n", CV[ind1].first, CV[ind1].second, CV[ind2].first,
           CV[ind2].second);
}

```

## 2.5 Sorting Points by Angle

```
// credit : http://koosaga.com/97
auto angle_sort = [&] (P &a, P &b){
    if((a < point(0, 0)) ^ (b < point(0, 0))) return b < a;
    if(a / b != 0) return a / b > 0;
    return a.dist2() < b.dist2(); // norm
}; // clockwise sort
```

## 2.6 Smallest Enclosing Circle

```
//Prove By Solving - https://www.acmicpc.net/problem/11930
int main(){
    scanf("%d", &N);
    for(int i = 1; i <= N; i++) scanf("%lf%lf%lf", &A[i].x, &A[i].y, &A[i].z);

    int t = 70000;
    double rate = 1.0;
    point cur = (point){0, 0, 0};
    for(int i = 1; i <= t; i++){
        int ind = 1;
        for(int j = 1; j <= N; j++){
            if( (A[j] - cur) * (A[j] - cur) >
                (A[ind] - cur) * (A[ind] - cur)) ind = j;
            cur = cur + (A[ind] - cur) * rate;
            rate *= 0.99;
        }
        double r = 0;
        for(int i = 1; i <= N; i++) r = max(r, (A[i] - cur) * (A[i] - cur));
        cout << sqrt(r);
        return 0;
    } // Non-deterministic, deterministic O(n lg n) requires Voronoi diagram
```

## 2.7 Polygon Area

### 2.7.1 Polygon Area

```
double ans = 0; // ans : double area
for(int i=0; i<points.size(); i++)
    ans += points[i] / points[(i+1 == points.size() ? 0 : i+1)];
```

## 3 Strings

### 3.1 Aho-Corasick Algorithm

```
namespace aho_corasick {
    const int MAXN = 100000, MAXC = 26;
    int trans[MAXN+1][MAXC];
    int fail[MAXN+1];
    bool term[MAXN+1];

    void build(const vector<string> &v) {
```

```
        setz(trans), setz(fail), setz(term);
        int cnode = 1;

#### 4.6 Global Min Cut

```
// Stoer-Wagner Algorithm, O(VE lg E)
int minimum_cut_phase(int n, int &s, int &t,
    vector<vector<int>> &adj, vector<int> vis){
    vector<int> dist(n);
    int mincut = 1e9;
    while(true){
        int pos = -1, cur = -1e9;
        for(int i=0; i<n; i++){
            if(!vis[i] && dist[i] > cur){
                cur = dist[i];
                pos = i;
            }
        }
        if(pos == -1) break;
        s = t;
        t = pos;
        mincut = cur;
    }
}
```

```

        vis[pos] = 1;
        for(int i=0; i<n; i++){
            if(!vis[i]) dist[i] += adj[pos][i];
        }
    }
    return mincut; // optimal s-t cut here is, {t} and V \ {t}
}

int solve(int n, vector<vector<int>> adj){
    if(n <= 1) return 0;
    vector<int> vis(n);
    int ans = 1e9;
    for(int i=0; i<n-1; i++){
        int s, t;
        ans = min(ans, minimum_cut_phase(n, s, t, adj, vis));
        vis[t] = 1;
        for(int j=0; j<n; j++){
            if(!vis[j]){
                adj[s][j] += adj[t][j];
                adj[j][s] += adj[j][t];
            }
        }
        adj[s][s] = 0;
    }
    return ans;
}

```

## 5 Network Flow

### 5.1 Theorems

**Max-flow Min-cut theorem** : 정점  $s$ 에서 정점  $t$ 까지 흐를 수 있는 최대 유량(max-flow)은 정점  $s$ 와 정점  $t$ 를 분리하는 간선들의 가중치 합(min-cut)과 같다.

**Vertex cover** : 어떤 그래프의 정점의 집합  $S$ 에 대해 그래프의 모든 간선이  $S$ 의 원소 중 최소 하나와 연결되어 있을 때,  $S$ 를 해당 그래프의 vertex cover라고 하며, minimum vertex cover는 최소 개수의 정점을 사용한 vertex cover이다.

**Independent set** : 어떤 그래프의 정점의 집합  $S$ 에 대해  $S$ 의 서로 다른 두 정점을 연결하는 간선이 없을 때,  $S$ 를 해당 그래프의 independent set이라고 하며, maximum independent set은 최대 개수의 정점을 사용한 independent set이다.

**Matching (independent edge set)** : 어떤 그래프의 간선의 집합  $S$ 에 대해  $S$ 의 서로 다른 두 간선이 공통된 정점을 가지지 않을 때,  $S$ 를 해당 그래프의 matching이라고 하며, maximum matching은 최대 개수의 간선을 사용한 matching이다.

**König's theorem** : 이분 그래프의 maximum matching의 크기는 minimum vertex cover의 것과 같다.

**Dinic's Algorithm** : 시간 복잡도  $O(V^2E)$ , unit capacity에서는  $\min(V^{2/3}E, E^{3/2})$ .

**Circulation Problem** : 새로운 source/sink  $s_n, t_n$ 를 만들어서 다음과 같이 간선을 추가하고  $\max flow(s_n \rightarrow t_n) = \sum l_i$ 인지 확인, 이후  $s \rightarrow t$ 로 maxflow

- $s_n \rightarrow b(l), a \rightarrow t_n(l), a \rightarrow b(r-l), t \rightarrow s(\infty)$

### 5.2 Dinic's Algorithm

```

const int INF = 1e9;
struct Dinic{
    int N;
    struct edge{
        int index, cap, rev;
        edge() : index(0), cap(0), rev(0) {}
        edge(int index, int cap, int rev) : index(index), cap(cap), rev(rev) {}
    };

    vector<vector<edge>> ADJ;
    vector<int> R, W;

    Dinic() {}
    Dinic(int N) : N(N){
        ADJ.resize(N); R.resize(N); W.resize(N);
    }

    void CE(int node1, int node2, int cap){
        ADJ[node1].push_back(edge(node2, cap, ADJ[node2].size()));
        ADJ[node2].push_back(edge(node1, 0, ADJ[node1].size() - 1));
    }

    bool bfs(int src, int sink){
        fill(R.begin(), R.end(), -1);
        R[src] = 0;
        queue<int> Q; Q.push(src);
        while(Q.size()){
            int here = Q.front(); Q.pop();
            for(auto e : ADJ[here]){
                if(e.cap > 0 && R[e.index] == -1)
                    R[e.index] = R[here] + 1, Q.push(e.index);
            }
        }
        return R[sink] != -1;
    }

    int dfs(int here, int sink, int f){
        if(here == sink) return f;
        for(int &i = W[here] ; i < ADJ[here].size() ; i++){
            auto &e = ADJ[here][i];
            if(e.cap > 0 && R[here] < R[e.index]){
                int res = dfs(e.index, sink, min(f, e.cap));
                if(res) {
                    e.cap -= res;
                    ADJ[e.index][e.rev].cap += res;
                    return res;
                }
            }
        }
        return 0;
    }
}

```

```

    return 0;
}

int solve(int src, int sink){
    int ret = 0;
    while(bfs(src, sink)){
        fill(W.begin(), W.end(), 0);
        int res;
        while((res = dfs(src, sink, INF))) ret += res;
    }
    return ret;
}
};

```

### 5.3 MCMF with SPFA

```

const int INF = 1e9;
struct MCMF {
    struct edge {
        int there, cap, cost, rev;

        edge() : there(0), cap(0), cost(0), rev(0) {}
        edge(int there, int cap, int cost, int rev) : there(there), cap(cap),
            cost(cost), rev(rev) {}
    };

    int N;
    vector<vector<edge>> ADJ;
    vector<int> R, INQ, C, I;

    MCMF() : N(0) {}
    MCMF(int N) : N(N) { ADJ.resize(N + 1); R.resize(N + 1); INQ.resize(N + 1);
        C.resize(N + 1); I.resize(N + 1); }

    void CE(int i, int j, int cap, int cost) {
        ADJ[i].push_back(edge(j, cap, cost, ADJ[j].size()));
        ADJ[j].push_back(edge(i, 0, -cost, ADJ[i].size() - 1));
    }

    bool SPFA(int src, int sink) {
        queue<int> Q; Q.push(src);
        fill(R.begin(), R.end(), -1); R[src] = 0;
        fill(C.begin(), C.end(), -1); C[src] = 0;
        fill(INQ.begin(), INQ.end(), 0); INQ[src] = 1;
        while (Q.size()) {
            int here = Q.front(); Q.pop();
            INQ[here] = 0;
            for (int i = 0; i < ADJ[here].size(); i++) {
                auto e = ADJ[here][i];
                if ((C[e.there] == -1 || C[e.there] > C[here] + e.cost)
                    && e.cap > 0) {
                    C[e.there] = C[here] + e.cost;

```

```

                    R[e.there] = here;
                    I[e.there] = i;
                    if (!INQ[e.there]) INQ[e.there] = 1, Q.push(e.there);
                }
            }
        }
        if (C[sink] == -1) return false;
        return true;
    }

    pii mcmf(int src, int sink) {
        pii ret = { 0, 0 };
        while (SPFA(src, sink)) {
            int flow = INF, cost = 0;
            for (int here = sink; here != src; here = R[here])
                flow = min(flow, ADJ[R[here]][I[here]].cap);
            for (int here = sink; here != src; here = R[here]) {
                auto &e = ADJ[R[here]][I[here]];
                cost += e.cost * flow;
                e.cap -= flow;
                ADJ[e.there][e.rev].cap += flow;
            }
            ret.first += flow, ret.second += cost;
        }
        return ret;
    }
};

```

### 5.4 Hungarian Method

```

namespace Hung {
    const int MX = 2000;
    // IMPORTANT : n <= m, 1-based
    using T = long double;

    T maxv = 1e200;
    T a[MX][MX], n, m;

    void init(int nn, int mm) { n = nn; m = mm; }
    void set_value(int x, int y, T val) { a[x][y] = val; }
    T solve(vector<int> &ans) {
        vector<T> v(m+1), u(n+1);
        vector<int> p (m+1), way (m+1);
        for (int i=1; i<=n; ++i) {
            p[0] = i;
            int j0 = 0;
            vector<T> minv (m+1, maxv);
            vector<char> used (m+1, false);
            do {
                used[j0] = true;
                T delta = maxv;

```

```

    int i0 = p[j0], j1;
    for (int j=1; j<=m; ++j) if (!used[j]) {
        T cur = a[i0][j]-u[i0]-v[j];
        if (cur < minv[j]) {
            minv[j] = cur, way[j] = j0;
        }
        if (minv[j] < delta) {
            delta = minv[j], j1 = j;
        }
    }
    for (int j=0; j<=m; ++j) {
        if (used[j]) {
            u[p[j]] += delta, v[j] -= delta;
        }
        else {
            minv[j] -= delta;
        }
    }
    j0 = j1;
} while (p[j0] != 0);
do {
    int j1 = way[j0];
    p[j0] = p[j1];
    j0 = j1;
} while (j0);
}
ans.resize(n + 1);
for(int j=1; j<=m; ++j) {
    ans[p[j]] = j;
}
return -v[0];
}
}

```

## 5.5 Hopcroft-Karp Algorithm

```

struct hopcroft_karp{
    int N;
    vector<vector<int>> ADJ;
    vector<int> L, rev, used;

    hopcroft_karp() {}
    hopcroft_karp(int N) : N(N) {
        ADJ.resize(N);
        L.resize(N), rev.resize(N, -1), used.resize(N, 0);
    }

    void CE(int here, int there){
        ADJ[here].push_back(there);
    }
}

```

```

void bfs(){
    queue<int> Q;
    for(int i = 0 ; i < N ; i++) {
        if(used[i]) L[i] = -1;
        else L[i] = 0, Q.push(i);
    }

    while(Q.size()){
        int here = Q.front(); Q.pop();
        for(int there : ADJ[here]){
            if(rev[there] != -1 && L[rev[there]] == -1) {
                L[rev[there]] = L[here] + 1;
                Q.push(rev[there]);
            }
        }
    }
}

bool dfs(int here){
    for(int there : ADJ[here]){
        if(rev[there] == -1 || (L[here] < L[rev[there]] && dfs(rev[there]))){
            rev[there] = here;
            used[here] = 1;
            return true;
        }
    }
    return false;
}

int solve(){
    int ret = 0;
    while(1){
        bfs();
        int res = 0;
        for(int i = 0 ; i < N ; i++) {
            if(used[i]) continue;
            res += dfs(i);
        }
        if(res == 0) break;
        ret += res;
    }
    return ret;
}
};

```

## 6 Optimization Tricks

### 6.1 Knuth Optimization

- Recurrence :  $D[i][j] = \min_{i < k < j} (D[i][k] + D[k][j]) + C[i][j]$

- Quadrangle Inequality :  $C[a][c] + C[b][d] \leq C[a][d] + C[b][c]$ ,  $a \leq b \leq c \leq d$
- Monotonicity :  $C[b][c] \leq C[a][d]$ ,  $a \leq b \leq c \leq d$
- $A[i][j] = (\min. k \text{ s.t. } D[i][j] \text{ is min.})$ . Then  $A[i][j-1] \leq A[i][j] \leq A[i+1][j]$
- $O(N^2)$  time complexity

```
// opt[i-1][i] = i
for(int d=2;d<=n;d++) {
    for(int i=1;i+d<=n+1;i++) {
        for(int k=opt[i][j-1], j=i+d; k<=opt[i+1][j]; k++) {
            int v = dp[i][k] + dp[k][j] + c[i][j];
            if(dp[i][j] > v) dp[i][j] = v, opt[i][j] = k;
        }
    }
}
```

## 6.2 Divide and Conquer Optimization

- Recurrence :  $D[t][i] = \min_{k < i} (D[t-1][k] + C[k][i])$
- Min index :  $A[t][i] \leq A[t][i+1]$  ( $A[t][i] = (\min. k \text{ s.t. } D[t][i] \text{ is min.})$ )
- Quadrangle Inequality :  $C[a][c] + C[b][d] \leq C[a][d] + C[b][c]$ ,  $a \leq b \leq c \leq d$
- Able to Divide and Conquer base on calculating  $D[t][i]$
- $O(TN \lg N)$  time complexity

```
// range of index : [l,r]
// range of dp : [s,e]
void dnc(int t, int l, int r, int s, int e)
{
    if(s > e) return;
    int m = (s+e)/2;
    D[t][m] = 2e9;
    for(int k=l;k<m&&k<=r;k++)
    {
        int tmp = D[t-1][k] + C[k][m];
        if(D[t][m] > tmp)
            D[t][m] = tmp, A[t][m] = k;
    }
    dnc(t, l, A[t][m], s, D[t][m]-1);
    dnc(t, A[t][m], r, D[t][m]+1, e);
}
```

## 6.3 Convex Hull Trick

- Recurrence :  $dp[i] = \min_{j < i} (dp[j] + a[i]b[j])$ ,  $b[i-1] \leq b[i]$
- Think as  $dp[x] = a[i] = \min_{j < i} (b[j] \cdot x + dp[j])$

- Thus push lines and find minimum (by binary search)
- If  $a[i] \leq a[i+1]$  sweeping is possible
- Intersection of  $y = a_i x + b_i$  and  $y = a_{i+1} x + b_{i+1} : x = \frac{b_{i+1} - b_i}{a_i - a_{i+1}}$

## 6.4 Centroid Decomposition

```
// credit : https://gist.github.com/igorcarpanese/75162f3253bd230abd0f32f9950bf384
int dfs(int u, int p) {
    sub[u] = 1;
    for (auto v : tree[u])
        if (v != p) sub[u] += dfs(v, u);
    return sub[u] + 1;
}

// each tree has at most two centroids
int centroid(int u, int p, int r) { // r : root
    for (auto v : tree[u])
        if (v != p and sub[v] > sub[r]/2) return centroid(v, u);
    return u;
}
```

## 7 Data Structure

### 7.1 Persistent Segment Tree

```
const MAXN = 1e5 + 10;
struct node{
    node *l, *r;
    int cnt;
    node () {}
} pool[(1 << 17) * 17], *tree_head[MAXN];

int tcnt;
node* alloc(){
    memset(pool + tcnt, 0, sizeof(node));
    return pool + tcnt++;
}

node * init(int l, int r){
    node *ret = alloc();
    if(l != r) {
        int mid = (l + r) / 2;
        ret->l = init(l, mid);
        ret->r = init(mid + 1, r);
    }
    return ret;
}

void update(node * here, node *par, int l, int r, int val){
```

```

    if(l == r) {
        here->cnt = par->cnt + 1;
        return;
    }

    int mid = (l + r) / 2;
    if(val <= mid){
        here->l = alloc();
        here->r = par->r;
        update(here->l, par->l, l, mid, val);
    }
    else {
        here->l = par->l;
        here->r = alloc();
        update(here->r, par->r, mid + 1, r, val);
    }
    here->cnt = here->l->cnt + here->r->cnt;
}

int query(node *node1, node *node2, int l, int r, int k){
    if(l == r) return l;
    int ccc = node1->l->cnt - node2->l->cnt;
    int mid = (l + r) / 2;
    if(k <= ccc) return query(node1->l, node2->l, l, mid, k);
    else return query(node1->r, node2->r, mid + 1, r, k - ccc);
}

```

## 7.2 Link-Cut Tree

```

struct node{
    node *pp, *p, *l, *r;
    int val;
    node(){ p = 0, l = 0, r = 0;}
    node(int val) : val(val) { p = 0, l = 0, r = 0;}
};

```

```

void push(node *x){}
void pull(node *x){}

```

```

void rotate(node *x){
    if(!x->p) return;
    push(x->p); // if there's lazy stuff
    push(x);
    node *p = x->p;
    bool is_left = (p->l == x);
    node *b = (is_left ? x->r : x->l);
    x->p = p->p;
    if(x->p && x->p->l == p) x->p->l = x;
    if(x->p && x->p->r == p) x->p->r = x;
    if(is_left){
        if(b) b->p = p;
    }
}

```

```

    p->l = b;
    p->p = x;
    x->r = p;
}
else{
    if(b) b->p = p;
    p->r = b;
    p->p = x;
    x->l = p;
}
pull(p); // if there's something to pull up
pull(x);
//if(!x->p) root = x; // IF YOU ARE SPLAY TREE
if(p->pp){ // IF YOU ARE LINK CUT TREE
    x->pp = p->pp;
    p->pp = nullptr;
}
}

void splay(node *x){
    while(x->p){
        node *p = x->p;
        node *g = p->p;
        if(g){
            if((p->l == x) ^ (g->l == p)) rotate(x);
            else rotate(p);
        }
        rotate(x);
    }
}

void access(node *x){
    splay(x);
    push(x);
    if(x->r){
        x->r->pp = x;
        x->r->p = nullptr;
        x->r = nullptr;
    }
    pull(x);
    while(x->pp){
        node *nxt = x->pp;
        splay(nxt);
        push(nxt);
        if(nxt->r){

        auto l = *lower_bound((Line) { x, is_query });
        return l.m * x + l.b;
    }
};

```

### 7.4 Stern-Brocot Tree

```

// __int128 is recommended
bool test(ll a, ll b) { // for testing directions, vary by prob
    // return true if (true value) >= a/b
    ll n = 0, m = 1;

    rep(i, N) {
        if (n < m*A[i].fi) n = A[i].fi, m = 1;

        ll c = b*n+m*a, d = m*b;
        ll g = gcd(c, d);
    }
}

```

```

    n = c/g;
    m = d/g;

    if (n > m*A[i].se) return false;
}
return true;
}

pair<ll, ll> stern_brocot(ll M, ll N) {
    // M : max value
    // N : max divisor
    // if result is a/b, return as {a, b}
    ll a = 0, b = 1; // l
    ll c = 1, d = 0; // r
    int l, r;
    bool chg = true;

    while(chg) {
        chg = false;

        // to left
        l = 0, r = (N-d-1)/b+1;
        while(l < r) {
            int mid = (l+r+1)/2;
            if (test(a*mid+c, b*mid+d)) r = mid-1;
            else l = mid;
        }

        c += a*l;
        d += b*l;
        chg |= (l > 0);

        l = 0, r = (d?(N-b-1)/d+1:M);
        while(l < r) {
            int mid = (l+r+1)/2;
            if (test(a+mid*c, b+mid*d)) l = mid;
            else r = mid-1;
        }

        a += c*l;
        b += d*l;
        chg |= (l > 0);
    }

    return {a, b};
}

```

## 7.5 Rope

```

#include <bits/stdc++.h>
#include <ext/rope>
using namespace std;
using namespace __gnu_cxx;

int main()
{
    ios::sync_with_stdio(false);
    cin.tie(0);

    crope rp; // rope<char>
    string s("Lorem-ipsum");
    int n = s.length();
    rp.append(s.c_str()); // add element

    int x = 3, y = 8; // split and merge below
    rp = rp.substr(x, y-x) + rp.substr(0, x) + rp.substr(y, n);
    cout << rp.at(0) << '\n'; // get element, 'e'
    cout << rp << '\n'; // print, "em-ip|Lor|sum"
}

```

## 7.6 Bitset

```

#include <bitset>
#include <iostream>
using namespace std;

int main() {
    bitset<8> b1(13);           // 00001101
    bitset<8> b2("10111");     // 00010111

    cout << b1.count() << endl; // 3
    cout << b1.test(6) << endl; // 0, since 2^6-th bit is 0
    b1.set(6);                  // set to 1, 1-fill if no param
    b2.reset(2);                // set to 0, 0-fill if no param
    // use 'flip' for flipping

    cout << "b1:" << b1 << endl; // b1:01001101
    cout << "b2:" << b2 << endl; // b2:00010011
    // use any, none, all (c++11) for bit checking
    // supported operators : &, |, ^, <<, >>, ~, ==, !=
    // these operators must match size (given to template)

    cout << "&: " << (b1 & b2) << endl; // &: 00000001
    cout << "^: " << (b1 ^ b2) << endl; // ^: 01011110
    cout << "|: " << (b1 | b2) << endl; // |: 01011111
    cout << "~: " << (~b1) << endl;     // ~: 10110010
    cout << "<<:" << (b1 << 3) << endl; // <<:01101000
    cout << b2.to_ulong() << endl;     // 19, c++11 supports ullong
}

```

```
}
```

## 7.7 Policy Based Data Structure

```
#include <bits/stdc++.h>
#include <ext/pb_ds/assoc_container.hpp>
#include <ext/pb_ds/tree_policy.hpp>
#include <ext/pb_ds/detail/standard_policies.hpp>

using namespace std;
using namespace __gnu_pbds;

typedef tree<
int,
null_type,
less<int>,
rb_tree_tag,
tree_order_statistics_node_update >
ordered_set;

// less<int> : not allow for duplicate
// less_equal<int> : allow for duplicate
// use upper_bound when you erase from set used less_equal

int N;

int main(void) {
    iosstream::sync_with_stdio(false);
    cin.tie(nullptr);

    ordered_set X;

    X.insert(1);
    X.insert(2);
    X.insert(4);
    X.insert(8);
    X.insert(16);

    cout<<*X.find_by_order(1)<<endl; // 2
    cout<<*X.find_by_order(2)<<endl; // 4
    cout<<*X.find_by_order(4)<<endl; // 16
    cout<<(end(X)==X.find_by_order(6))<<endl; // true

    cout<<X.order_of_key(-5)<<endl; // 0
    cout<<X.order_of_key(1)<<endl; // 0
    cout<<X.order_of_key(3)<<endl; // 2
    cout<<X.order_of_key(4)<<endl; // 2
    cout<<X.order_of_key(400)<<endl; // 5
}
```

## 8 Miscellaneous

### 8.1 Misc Formulae and Algorithms

#### 8.1.1 Faulhaber's Formula

$$T(n, k) = \sum_{i=1}^n i^k = \frac{(n+1)^{k+1} - 1^{k+1} - \sum_{j=0}^{k-1} \binom{k+1}{j} T(n, j)}{\binom{k+1}{k}}$$

Also use

$$(x+1)^d - x^d = 1 + \binom{d}{1}x + \binom{d}{2}x^2 + \cdots + \binom{d}{d-1}x^{d-1}$$

to get each coef.

#### 8.1.2 Maximum Clique

```
typedef long long ll;
ll G[40]; // 0-index
int N, M;
int cur;
void get_clique(int R = 0, ll P = (1ll<<N)-1, ll X = 0){
    if((P|X) == 0){
        cur = max(cur, R);
        return;
    }
    int u = __builtin_ctzll(P|X);
    ll c = P&~G[u];
    while(c){
        int v = __builtin_ctzll(c);
        get_clique(R + 1, P&G[v], X&G[v]);
        P ^= 1ll << v;
        X |= 1ll << v;
        c ^= 1ll << v;
    }
}
```

#### 8.1.3 De Bruijn Sequence

```
// https://github.com/koosaga/DeobureoMinkyuParty/blob/master/teamnote.tex
// alphabet = [0, k - 1], substr length n, res starts with 0 (cyclic)
int res[10000000], aux[10000000]; // >= k^n, k*n
int de_bruijn(int k, int n, int lim) { // returns size (k^n)
    if(k == 1) {
        res[0] = 0;
        return 1;
    }
    for(int i = 0; i < k * n; i++) aux[i] = 0;
    int sz = 0;
    function<void(int, int)> db = [&](int t, int p) {
        if(sz > lim) return;
        if(t > n) {
```

```

    if(n % p == 0)
        for(int i = 1; i <= p; i++)
            res[sz++] = aux[i];
    }
    else {
        aux[t] = aux[t - p];
        db(t + 1, p);
        for(int i = aux[t - p] + 1; i < k; i++) {
            aux[t] = i;
            db(t + 1, t);
        }
    }
};
db(1, 1);
return sz;
}

```
