#### 1 Math

#### 1.1 Basic Mathematics

#### 1.1.1 Trigonometry

- $\sin(\alpha \pm \beta) = \sin \alpha \cos \beta \pm \cos \alpha \sin \beta$
- $\cos(\alpha \pm \beta) = \cos \alpha \cos \beta \mp \sin \alpha \sin \beta$
- $\tan(\alpha \pm \beta) = \frac{\tan \alpha \pm \tan \beta}{1 \mp \tan \alpha \tan \beta}$
- $\sin 2\theta = 2\sin\theta\cos\theta$
- $c^2 = a^2 + b^2 2ab\cos\gamma$

#### 1.1.2 Generating Function

- $\sum_{n} (pn+q)x^{n} = \frac{p}{1-x} + \frac{q}{(1-x)^{2}}$  (Arithmetic progression)
- $\sum_{n} (rx)^n = (1 rx)^{-1}$  (Geometric progression)
- $\sum_{n} {m \choose n} x^n = (1+x)^m$  (Binomial coefficient)
- $\sum_{n} {m+n-1 \choose n} x^n = (1-x)^{-m}$  (Multiset coefficient)

#### 1.1.3 Calculus

- $\int_a^b f(x) dx = \frac{b-a}{6} \left[ f(a) + 4f(\frac{a+b}{2}) + f(b) \right]$  (Simpson's Rule, for cubic poly)
- $\int u'v \ dx = uv \int uv' \ dx$  (Integration by parts)

#### 1.1.4 Combinatorics

- $\begin{bmatrix} n \\ k \end{bmatrix}$  (Stirling numbers of the first kind / n elem, k cycle)
- ${n+1 \brack k} = n {n \brack k} + {n \brack k-1}, {n \brack 0} = {0 \brack n} = {0 \brack 0} = 1$
- ${n \brace k}$  (Stirling numbers of the second kind / n elem, k unlabeled subset)
- ${n+1 \choose k} = k {n \choose k} + {n \choose k-1}, {n \choose 0} = {0 \choose n} = {0 \choose 0} = 1$

 $B_n$  (Bell number, n elem, partition)

- $B_{n+1} = \sum_{k=0}^{n} {n \choose k} B_k, B_{n+1} = \sum_{k=0}^{n} {n \choose k}$
- $\bullet \ B_{p^m+n} \equiv mB_n + B_{n+1}$

#### 1.2 Number Theory

#### 1.2.1 Lattice Points under Line

```

#### 5 Network Flow

#### 5.1 Theorems

**Max-flow Min-cut theorem** : 정점 s에서 정점 t까지 흐를 수 있는 최대 유량(max-flow)은 정점 s와 정점 t를 분리하는 간선들의 가중치 합(min-cut)과 같다.

Vertex cover: 어떤 그래프의 정점의 집합 S에 대해 그래프의 모든 간선이 S의 원소 중 최소 하나와 연결되어 있을 때, S를 해당 그래프의 vertex cover라고 하며, minimum vertex cover는 최소 개수의 정점을 사용한 vertex cover이다.

Independent set : 어떤 그래프의 정점의 집합 S에 대해 S의 서로 다른 두 정점을 연결하는 간선이 없을 때, S를 해당 그래프의 independent set이라고 하며, maximum independent set은 최대 개수의 정점을 사용한 independent set이다.

Matching (independent edge set) : 어떤 그래프의 간선의 집합 S에 대해 S의 서로 다른 두 간선이 공통된 정점을 가지지 않을 때, S를 해당 그래프의 matching이라고 하며, maximum matching은 최대 개수의 간선을 사용한 matching이다.

König's theorem : 이분 그래프의 maximum matching의 크기는 minimum vertex cover의 것과 같다. Dinic's Algorithm : 시간 복잡도  $O(V^2E)$ , unit capacity에서는  $\min(V^{2/3}E, E^{3/2})$ .

**Circulation Problem** : 새로운 source/sink  $s_n$ ,  $t_n$ 를 만들어서 다음과 같이 간선을 추가하고  $maxflow(s_n \to t_n) = \sum l_i$ 인지 확인, 이후  $s \to t$ 로 maxflow

```
• s_n \to b (l), a \to t_n (l), a \to b (r-l), t \to s (\infty)
```

#### 5.2 Dinic's Algorithm

```

```

## 6 Optimization Tricks

An array P[i][j] is Monge array if  $\forall a \leq b \leq c \leq d$ ,  $C[a][c] + C[b][d] \leq C[a][d] + C[b][c]$ .

## 6.1 Knuth Optimization

- Recurrence :  $D[i][j] = \min_{i < k < j} (D[i][k] + D[k][j]) + C[i][j]$
- Condition:  $\forall a \leq b \leq c \leq d$ , C[i][j] is Monge array and  $C[b][c] \leq C[a][d]$  (monotonic)
- $A[i][j] = (\min k \text{ s.t. } D[i][j] \text{ is min.}). \text{ Then } A[i][j-1] \le A[i][j] \le A[i+1][j]$
- Time Complexity:  $O(N^3) \to O(N^2)$

```
// opt[i-1][i] = i
for(int d=2;d<=n;d++) {
    for(int i=1;i+d<=n+1;i++) {
        for(int k=opt[i][j-1], j=i+d; k<=opt[i+1][j]; k++) {
            int v = dp[i][k] + dp[k][j] + c[i][j];
            if(dp[i][j] > v) dp[i][j] = v, opt[i][j] = k;
        }
    }
}
```

#### 6.2 Divide and Conquer Optimization

- Recurrence :  $D[t][i] = \min_{k < i} (D[t-1][k] + C[k][i])$
- Condition: C[i][j] is Monge array.
- $A[t][i] \le A[t][i+1]$   $(A[t][i] = (\min. k \text{ s.t. } D[t][i] \text{ is min.}))$  holds
- Able to Divide and Conquer base on calculating D[t][i]
- Time Complexity:  $O(TN^2) \to O(TN \lg N)$

```
// range of index : [1,r]
// range of dp : [s,e]
void dnc(int t, int 1, int r, int s, int e)
{
    if(s > e) return;
    int m = (s+e)/2;
    D[t][m] = 2e9;
    for(int k=1;k<m&&k<=r;k++)
    {
        int tmp = D[t-1][k] + C[k][m];
        if(D[t][m] > tmp)
            D[t][m] = tmp, A[t][m] = k;
    }
    dnc(t, 1, A[t][m], s, D[t][m]-1);
    dnc(t, A[t][m], r, D[t][m]+1, e);
}
```

Page 16 of 22

#### 6.3 Convex Hull Trick

- Recurrence :  $dp[i] = \min_{j < i} (dp[j] + a[i]b[j])$
- Condition: None, but usually b[i] is monotonic. If not, refer to Section 7.3.
- Time Complexity:  $O(N^2) \to O(N \lg N)$ , O(N) if a[i] is monotonic by taking valid front.

```
using 11 = long long:
struct line {
    ll a, b, i;
    line(ll a=0, ll b=0, ll i=0) : a(a), b(b), i(i) {}
    ll calc(ll x) { return a*x+b; }
    double inter(line 1) { return double(1.b - b) / (a - 1.a): }
};
bool check_back(line& p0, line& p1, line& p2) {
    return (p1.b - p0.b) * (p1.a - p2.a) >= (p0.a - p1.a) * (p2.b - p1.b);
    return p0.inter(p1) > p1.inter(p2); // double
}
bool check_front(ll x, line& p0, line& p1) {
    return x * (p0.a - p1.a) >= (p1.b - p0.b);
    return x > p0.inter(p1);
}
struct ConvexHull {
    int 1 = 0, r = 0:
    vector<line> v;
    void insert(line p) {
        while(r - 1 >= 2 && check_back(v[r-2], v[r-1], p))
            v.pop_back(), r--;
        v.push_back(p);
    pair<11, 11> query(11 x) { // if x is increasing, else do binary search
        while(r - 1 >= 2 && check front(x, v[1], v[1+1]))
        return pair<11, 11>{v[1].calc(x), v[1].i};
    }
};
void calc() { // psuedo-code
    ConvexHull ch:
    11 val = 0, cnt = 0; // current dp and track
    for(int i=0:i<N:i++) {</pre>
        ch.insert(line{p[i], q[i]}); // j-dependent values (b[j], dp[j])
        pll res = ch.query(x[i]);
        val = res.first + c[i]: // i-dependent values
        cnt = res.second + 1;
    }
    return pll{val, cnt};
```

#### 6.4 Centroid Decomposition

```
// credit : https://gist.github.com/igorcarpanese/75162f3253bd230abd0f32f9950bf384
int dfs(int u, int p) {
    sub[u] = 1:
   for (auto v : tree[u])
        if (v != p and !chk[v]) sub[u] += dfs(v, u);
   return sub[u] + 1:
} // calc subtree size, chk means that node was a centroid
// each tree has at most two centroids
int centroid(int u, int p, int r) { // r : root
    for (auto v : tree[u])
        if (v \mid = p \text{ and } ! \text{chk}[v] \text{ and } \text{sub}[v] > \text{sub}[r]/2) \text{ return centroid}(v, u, r):
    return u;
6.5 Aliens Trick
  • Recurrence: dp[i][j] = Min_{k < j}(dp[i-1][k] + C[k+1][j])
  • Condition: dp[*][n] is convex (implied if dp[*][n] is Monge array)
11 calc(...) {

cout<<X.order_of_key(3)<<endl; // 2
cout<<X.order_of_key(4)<<endl; // 2
cout<<X.order_of_key(4)<<endl; // 2</pre>
```

#### 8 Miscellaneous

## 8.1 Misc Formulae and Algorithms

#### 8.1.1 Faulhaber's Formula

$$T(n,k) = \sum_{i=1}^{n} i^{k} = \frac{(n+1)^{k+1} - 1^{k+1} - \sum_{j=0}^{k-1} {k+1 \choose j} T(n,j)}{{k+1 \choose k}}$$

Also use

$$(x+1)^d - x^d = 1 + {d \choose 1}x + {d \choose 2}x^2 + \dots + {d \choose d-1}x^{d-1}$$

to get each coef.

#### 8.1.2 Maximum Clique

```
typedef long long 11;
11 G[40]: // 0-index
int N, M;
int cur:
void get_clique(int R = 0, 11 P = (111<<N)-1, 11 X = 0){
    if((P|X) == 0){
        cur = max(cur, R);
        return;
   }
   int u = __builtin_ctzll(P|X);
   11 c = P\&^{G}[u];
   while(c){
        int v = __builtin_ctzll(c);
        get_clique(R + 1, P&G[v], X&G[v]);
        P ^= 111 << v:
       X = 111 << v;
        c ^= 111 << v;
```
